

Based on the map above, we can see that the states with the highest number of undergrad enrolments is California, Texas, and New York, all of which has more than 200,000 enrolments.

The bar chart allows us to see among all the universities in California, Texas, and New York respectively, which universities' undergrad enrolment numbers is above or below the average number of undergrad enrolment in the corresponding state using the reference line.

The bar chart above makes use of the parameter 'Fee ceiling'. Using this parameter, we can see instantaneously which universities' tuition fees in the three states – California, Texas, and New York, exceed the ceiling that we set. When we change the ceiling using the slider on the left, the results are reflected on the graph immediately.

The scatter plot above shows us the general relationship between tuition fees and ranking of the universities using the trend line – the more prestige the university is (lower ranking), the more expensive their tuition fees are, vice-versa.
